

SECTION 7.9

ENTRAINED PAVED ROAD DUST PAVED ROAD TRAVEL

(Updated July 1997)

EMISSION INVENTORY SOURCE CATEGORY

Miscellaneous Processes / Road Dust

EMISSION INVENTORY CODES (CES CODES) AND DESCRIPTION

640-635-5400-0000 (83618) Paved Entrained Road Dust - Freeways

640-637-5400-0000 (83626) Paved Entrained Road Dust - Major Streets

640-639-5400-0000 (83634) Paved Entrained Road Dust - Collector Streets

640-641-5400-0000 (83642) Paved Entrained Road Dust - Local Streets

640-636-5400-0000 (47456) Paved Entrained Road Dust - Paved Roads
(obsolete)

METHODS AND SOURCES

The paved road dust category includes emissions of fugitive dust particulate matter entrained by vehicular travel on paved roads. Road dust emissions are estimated for four classes of roads. The four classifications are: 1) freeways/expressways, 2) major streets/highways, 3) collector streets, and 4) local streets. The estimated particulate matter emissions for paved road dust for each California county are listed in Table 1. Table 2 shows the portion of travel on each of the four major road types in each county.

OVERVIEW OF ESTIMATION METHODOLOGY

Dust emissions from vehicle travel on paved roads are computed using the emission factor equation provided in the Fifth Edition of U.S. EPA's AP-42 document.¹ Inputs to the paved road dust equation were developed from California specific roadway silt loading and average vehicle weight data measured by Midwest Research Institute (MRI) in 1995.² Data from the Air Resources Board and air districts were used to estimate county specific VMT (vehicle miles traveled) data.^{3,4} Caltrans HPMS (Highway Performance Monitoring System)⁵ data were used to estimate the fraction of travel on each of the four road types in each county. The paved road dust category does not include directly emitted brake and tire wear, nor TOG, CO, NO_x, SO_x, or PM exhaust emissions. These directly emitted motor vehicle emissions are included in the motor vehicle emission inventory.

EMISSIONS ESTIMATION METHODOLOGY

The emission factor provided by the EPA for estimating entrained dust emissions from vehicles traveling on paved roads is:

$$E = k \left(\frac{sL}{2} \right)^{0.65} \left(\frac{W}{3} \right)^{1.5}$$

where E is the particulate emission factor in units of pounds of particulate matter per VMT, k is the particle size multiplier (used to compute PM₁₀, PM_{2.5}, etc.), sL is the roadway silt loading in grams/square meter, and W is the average weight (in tons) of vehicles traveling the road.

The statewide average vehicle weight is assumed to be 2.4 tons. This estimate is based on an informal traffic count estimated by MRI while they were performing California silt loading measurements. Table 3 shows the roadway silt loadings and emission factors used in each California county. The silt loading values are the averages of silt loadings measured by MRI in the South Coast AQMD and the San Joaquin Valley Unified AQMD.² (Note: The South Coast Air Quality Management District (SCAQMD) computed county specific average vehicle weight estimates by using average fleet weights with estimates of the amount of VMT traveled by each vehicle class. The weights used are shown in Table 3.)

The county roadway emission factors, combined with ARB and air district VMT data^{3,4} for each roadway type, are linked with the Caltrans HPMS data⁵ to estimate emissions for each road type in each county. Further detail on the derivation of the paved road dust emission factors, silt loadings, and roadway travel fractions are available in the ARB background document for entrained paved road dust.⁶

TEMPORAL ACTIVITY AND GROWTH

Temporal activity is assumed to be the same as on-road vehicle travel: uniform in spring and fall, increasing slightly in summer, and decreasing slightly in winter. The monthly temporal profile below shows this trend. The weekly and daily activities are estimated to have higher activities on weekdays and during daylight hours.

| CES | Hours | Days | Weeks |
|-----|-------|------|-------|
| ALL | 24 | 7 | 52 |

| CES | JAN | FEB | MAR | APR | MAY | JUN | JUL | AUG | SEP | OCT | NOV | DEC |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| ALL | 7.7 | 7.7 | 8.5 | 8.5 | 8.5 | 8.5 | 8.5 | 8.5 | 8.5 | 8.5 | 8.5 | 7.7 |

ASSUMPTIONS AND LIMITATIONS

1. The current AP-42 emission factor assumes that road dust emissions are proportional to VMT, roadway silt loading, and average vehicle weight.
2. Virtually the same silt loading values are used throughout the state. These silt loadings are based on a total of eight silt loading measurements each in the South Coast Area, Coachella Valley, and Bakersfield. This does not fully represent the variability in California silt loading.
3. The methodology assumes that roadway silt loading, and therefore the emission factor, varies by the type of road.
4. It is assumed that the EPA particle size multiplier (i.e., the 'k' factor in the AP-42 equation) reasonably represents the size distribution of California paved road dust.
5. The average vehicle fleet weight is assumed to be 2.4 tons, statewide (except for the SCAQMD).
6. For freeway and major roads, emissions growth is assumed to be proportional to changes in roadway centerline mileage. For collector and local roads, emissions growth is assumed proportional to changes in VMT.

CHANGES IN THE METHODOLOGY

There were substantial changes in the paved road dust emission estimates for this update. These include:

- Incorporation of the new EPA paved road emission factor from the Fifth Edition of EPA's AP-42 document (January 1995, Section 13.2.1).
- Update of the Vehicle Miles Traveled (VMT) data to 1993 levels based on ARB and Air District supplied values.
- Update of the fractions of vehicle miles traveled on each of the four major roadway categories (i.e., freeways, major roads, collectors, and local roads) to reflect 1993 data.
- Incorporation of California specific roadway silt loading values.
- Emissions growth was changed so that freeways and major roads are grown based on increases in roadway centerline mileage, and local and collector roads are grown based on increases in VMT. Previously, all roads were grown based on VMT.

The changes reduced the paved road dust emission estimates by about 70% from the previous 1993 published emission inventory estimates.

COMMENTS AND RECOMMENDATIONS

Studies are ongoing by the University of California, Riverside, and the University of California, Davis, to better understand and quantify paved road dust emissions. These studies are not showing clear correlations between roadway silt loading and dust production, or VMT and dust production in urban areas. The results of these studies will be incorporated into this methodology when they are available. Also, effort is needed to better account for the variability in dust emissions based on population density, adjacent land uses, and geographic location.

SAMPLE CALCULATIONS

The table below summarizes the data computations necessary to estimate the paved road dust emissions in Santa Cruz county. The following steps are performed:

- Step 1: Silt Loadings. Use the ARB default silt loadings, or local silt loadings if better data are available. Detailed information on the derivation of the ARB default values is included in reference 6.
- Step 2: Emission Factor. Using the silt loadings shown and the AP-42 emission factor equation shown previously, compute the emission factor for each road type. In this case, a default average vehicle weight of 2.4 tons is used. Also, because PM₁₀ emissions are being computed, a 'k' factor of 0.016 is used from AP-42. For reference, the 'k' factor for PM_{2.5} is 0.0073 (for units of lb/VMT).
- Step 3: Using the data in Table 2, fill in the county specific travel fraction data. These data are derived from Caltrans HPMS data.⁵ See reference 6 for additional information on how the traffic splits were derived.
- Step 4: Using the county total VMT values provided in Table 1, and the travel fraction values from Step 3, compute the VMT traveled on each roadway type.
 $Total\ VMT \times Travel\ Fraction = Road\ VMT.$
- Step 5: Multiply the emission factors in Step 2 by the VMT data in Step 4 to compute the PM₁₀ emissions for each road type. $Road\ EF \times Road\ VMT = Road\ Emissions.$ Divide the computed values by 2000 lbs/ton to get the annual tons of PM₁₀/year from paved road dust.
- Step 6: The ARB's database system maintains particulate emissions as Total Suspended Particulates (TSP). Therefore, the PM₁₀ emissions must be converted to TSP emissions. For California paved road dust, it is estimated that 46% of TSP is PM₁₀, therefore, dividing the PM₁₀ value by 0.46 produces the correct TSP emissions.⁷

Estimating Paved Road Dust Emissions In Santa Cruz County

| | | Road Type | | | | |
|---------------|---|-----------|-------|-----------|-------|--------|
| | | Freeway | Major | Collector | Local | |
| <i>Step 1</i> | Silt Loading (g/m ²) | 0.02 | 0.035 | 0.32 | 0.32 | |
| <i>Step 2</i> | Emission Factor (lbs PM ₁₀ /1e6 VMT) | 574 | 825 | 825 | 3479 | Totals |
| <i>Step 3</i> | Travel Fraction | 0.285 | 0.465 | 0.181 | 0.069 | 1 |
| <i>Step 4</i> | VMT (1993, million/yr) | 519 | 847 | 330 | 125 | 1821 |
| <i>Step 5</i> | PM ₁₀ Emissions (tons /yr) | 149 | 349 | 136 | 219 | 853 |
| <i>Step 6</i> | TSP Emissions (tons/yr) | 324 | 759 | 296 | 476 | 1855 |

* The VMT for most counties is from the ARB's EMFAC/BURDEN 7F runs performed for the 1993 ozone SIPs. The VMT for the SCAQMD and SJVUAPCD was provided by each district from their local transportation agencies.

TABLE 3
Silt Loadings and Emission Factors for
California Entrained Paved Road Dust Estimates

| AIR BASIN | COUNTY | Silt Loadings and PM ₁₀ Emission Factors | | | | | | | | | | Average Vehicle Weight (tons) |
|----------------------------------|--|---|--|----------------------------------|--|----------------------------------|--|----------------------------------|--|----------------------------------|--|--|
| | | Freeway | | Major | | Collector | | Local | | Local Rural (1) | | |
| Silt Load (g/m ²) | EF (lbs PM ₁₀ per 10 ⁶ VMT) | Silt Load (g/m ²) | EF (lbs PM ₁₀ per 10 ⁶ VMT) | Silt Load (g/m ²) | EF (lbs PM ₁₀ per 10 ⁶ VMT) | Silt Load (g/m ²) | EF (lbs PM ₁₀ per 10 ⁶ VMT) | Silt Load (g/m ²) | EF (lbs PM ₁₀ per 10 ⁶ VMT) | Silt Load (g/m ²) | EF (lbs PM ₁₀ per 10 ⁶ VMT) | |

Notes for Table 3.

- (1) The SJVUAPCD splits local roads into urban and rural classes, and uses separate silt loading values.
- (2) The SCAQMD uses the median, rather than the average value of the BACM silt loading values.
- (3) The SCAQMD computed county specific vehicle weight averages. Los Angeles and Orange Counties have an average vehicle weight value of 2.7 tons. Riverside has a value of 3.2 tons, and San Bernardino is set to 3.4 tons.
- (4) In Imperial county, a silt loading value of 0.32 is used for collector roads to account for the large portion of developed areas.
- (5) The SJV district splits their local roads into urban and rural roads. A higher silt loading value derived from AP-42 data is used in computing emissions for rural local roads due to anticipated higher loading levels.
